**Subject:** Toxicological Evaluation of Results from an Ambient Air Sample for Volatile Organic Compounds Collected Downwind of Cowtown Pipeline Partners, LP – Alliance Compressor Station (Latitude 33.035213, Longitude -97.346942) near Justin, Denton County, Texas.

Sample Collected on February 7, 2017, Request Number 1702006 (Lab Sample 1702006-001).

---

## Key Points

- Reported concentrations of target volatile organic compounds (VOCs) were either not detected or were detected below levels of short-term health and/or welfare concern.

## Background

On February 7, 2017, a Texas Commission on Environmental Quality (TCEQ) Region 4 air investigator collected a 30-minute canister sample (Lab Sample 1702006-001) downwind of Cowtown Pipeline Partners, LP – Alliance Compressor Station near Justin, Denton County, Texas (Latitude 33.035213, Longitude -97.346942). The sample was collected in response to a citizen complaint of ammonia and gasoline odors and a sore throat. The investigator experienced a skunk-like odor but no health effects while sampling. Meteorological conditions measured at the site or nearest stationary ambient air monitoring site indicated that the ambient temperature was 91°F with a relative humidity of 42%, and winds were from the southwest (220°) at 1.8 miles per hour. The sampling site was 101-300 feet from the possible emission source. The nearest location where the public could have access was >501 feet from the possible emission source (multiple emission sources). The sample was sent to the TCEQ laboratory in Austin, Texas, and analyzed for a range of VOCs. The list of the target analytes that were evaluated in this review is provided in Attachment A. The VOC concentrations were reported in parts per

billion by volume (ppbv) (Attachment B and Table 1). Please note that the available canister technology and analysis method cannot capture and/or analyze for all chemicals.

## **Results and Evaluation**

Reported VOC concentrations were compared to TCEQ's short-term health- and/or welfare-based air monitoring comparison values (AMCVs) (Table 1). Short-term AMCVs are guidelines used to evaluate ambient concentrations of a chemical in air and to determine its potential to result in adverse health effects, adverse vegetative effects, or odors. Health AMCVs are set to provide a margin of safety and are set well below levels at which adverse health effects are reported in the scientific literature. If a chemical concentration in ambient air is less than its comparison value, no adverse health effects are expected to occur. If a chemical concentration exceeds its comparison value it does not necessarily mean that adverse effects will occur, but rather that further evaluation is warranted.

All of the 84 VOCs were either not detected or were detected below their respective short-term AMCVs. Exposure to levels of VOCs measured in this sample would not be expected to cause short-term adverse health effects, adverse vegetative effects, or odors.

Please call me at (512) 239-1785 if you have any questions regarding this evaluation.
